

FCC  
SAR  
TEST REPORT

ISSUED BY  
Shenzhen BALUN Technology Co., Ltd.

FOR  
**Mobile Phone**

ISSUED TO  
ShenZhen Hipad Telecommunication Technology Co., LTD.

Room 502-503, Unit 3, Building C, Kexing Science Park, Keyuan  
Road, Hi-tech industrial Park, NanShan District, Shenzhen, GuangDong,  
China.

## 1 GENERAL INFORMATION

### 1.1 Identification of the Testing Laboratory

|              |   |
|--------------|---|
| Company Name | Shenzhen BALUN Technology Co., Ltd.   |
| Address      | Block B, 1st FL, Baisha Science and Technology Park, Shahe Xi Road, Nanshan District, Shenzhen, Guangdong Province, P. R. China |
| Phone Number | +86 755 6683 3402   |
| Fax Number   | +86 755 6182 4271   |

### 1.2 Identification of the Responsible Testing Location

|                           |  |
|---------------------------|--|
| Test Location             | Shenzhen BALUN Technology Co., Ltd.  |
| Address                   | Block B, 1st FL, Baisha Science and Technology Park, Shahe Xi Road, Nanshan District, Shenzhen, Guangdong Province, P. R. China  |
| Accreditation Certificate | The laboratory has been listed by Industry Canada to perform electromagnetic emission measurements. The recognition numbers of test site are 11524A-1.<br>The laboratory has been listed by US Federal Communications Commission to perform electromagnetic emission measurements. The recognition numbers of test site are 832625.<br>The laboratory has met the requirements of the IAS Accreditation Criteria for Testing Laboratories (AC89), has demonstrated compliance with ISO/IEC Standard 17025:2005. The accreditation certificate number is TL-588.<br>The laboratory is a testing organization accredited by China National Accreditation Service for Conformity Assessment (CNAS) according to ISO/IEC 17025. The accreditation certificate number is L6791. |
| Description               | All measurement facilities used to collect the measurement data are located at Block B, FL 1, Baisha Science and Technology Park, Shahe Xi Road, Nanshan District, Shenzhen, Guangdong Province, P. R. China 518055  |

### 1.3 Test Environment Condition

|                           |               |
|---------------------------|---------------|
| Ambient Temperature       | 20 to 23 °C   |
| Ambient Relative Humidity | 30 to 60 %    |
| Ambient Pressure          | 86 to 106 kPa |

### 1.4 Announce

- (1) The test report is invalid if not marked with the signatures of the persons responsible for preparing and approving the test report.
- (2) The test report is invalid if there is any evidence and/or falsification.
- (3) The results documented in this report apply only to the tested sample, under the conditions and modes of

operation as described herein.

- (4) This document may not be altered or revised in any way unless done so by BALUN and all revisions are duly noted in the revisions section.
- (5) Content of the test report, in part or in full, cannot be used for publicity and/or promotional purposes without prior written approval from the laboratory.

## 2 PRODUCT INFORMATION

### 2.1 Applicant

|           |  |
|-----------|--|
| Applicant | ShenZhen Hipad Telecommunication Technology Co., LTD.  |
| Address   | Room 502-503, Unit 3,Building C, Kexing Science Park, Keyuan Road, Hi-tech industrial Park, NanShan District, Shenzhen, GuangDong, China |

### 2.2 Manufacturer

|              |  |
|--------------|--|
| Manufacturer | ShenZhen Hipad Telecommunication Technology Co., LTD.  |
| Address      | Room 502-503, Unit 3,Building C, Kexing Science Park, Keyuan Road, Hi-tech industrial Park, NanShan District, Shenzhen, GuangDong, China |

### 2.3 General Description for Equipment under Test (EUT)

|                                   |  |
|-----------------------------------|--|
| EUT Type                          | Moblie Phone   |
| Model Under the test              | MK5022,MK5022-CA,MK5022-MX   |
| Series Model Name                 | N/A  |
| Difference description            | Only different in model name   |
| Hardware Version                  | WS4050_V1.2  |
| Software Version                  | N/A  |
| Dimensions                        | 115×60×10 mm   |
| Diagonal dimension                | 120 mm   |
| Weight                            | 104 g  |
| Network and Wireless connectivity | 2G Network GSM 850 / 1900<br>3G Network WCDMA 850 / 1900<br>WLAN, Bluetooth, |
| Display                           | TFT-LCD  |
| Chipset                           | N/A  |

### 2.4 Technical Information

The requirement for the following technical information of the EUT was tested in this report:

|                 |  |
|-----------------|--|
| Operating Mode  | GSM: GSM Voice; GPRS Class 12; EDGE Class 12;<br>WCDMA: RMC/HSDPA/HSUPA Release 6;<br>WLAN: 802.11 b/g/n(HT20);<br>Bluetooth: 3.0+EDR  |
| Frequency Range | GSM 850: 824.2 MHz ~ 848.8 MHz;<br>GSM 1900: 1850.2 MHz ~ 1909.8 MHz;<br>WCDMA 850: 826.4 MHz ~ 846.6 MHz;<br>WCDMA 1900: 1852.4 MHz ~ 1907.6 MHz;<br>WLAN 802.11b/g/n(HT20): 2412 MHz ~ 2462 MHz;<br>Bluetooth: 2402 MHz ~ 2480 MHz |

|                  |  |
|------------------|--|
| Antenna Type     | WWAN: PIFA Antenna<br>WLAN: PIFA Antenna<br>Bluetooth: PIFA Antenna                    |
| Dual-SIM         | Only supported dual standby; the dual SIM card share same RF circuit and NV parameter. |
| DTM              | Not Support  |
| Hotspot Function | Support  |
| Environment      | Uncontrolled   |
| EUT Stage        | Portable Device  |

## 2.5 Ancillary Equipment

|                       |                                  |                                      |
|-----------------------|----------------------------------|--------------------------------------|
| Ancillary Equipment 1 | Battery                          |                                      |
|                       | Brand Name                       | KingerPower                          |
|                       | Model No                         | 29.B0628000008                       |
|                       | Serial No                        | N/A                                  |
|                       | Capacitance                      | 1100 mAh                             |
|                       | Rated Voltage                    | 3.7 V                                |
|                       | Extreme Voltage                  | Low: 3.5 V / High:4.2 V              |
| Ancillary Equipment 2 | AC Adapter (Charger for Battery) |                                      |
|                       | Brand Name                       | AOHAI                                |
|                       | Model No                         | A75-500550-US                        |
|                       | Serial No                        | (n.a. marked #1 by test site)        |
|                       | Rated Input                      | ~ 100~240V,150 mA,50/60 Hz, Max:36 W |
|                       | Rated Output                     | --- 5 V, 550 mA, Max: 2.75 W         |
| Ancillary Equipment 3 | Stereo Headset                   |                                      |
| Ancillary Equipment 4 | USB Data Cable                   |                                      |

### 3 SUMMARY OF TEST RESULTS

#### 3.1 Test Standards

| No. | Identity                  | Document Title  |
|-----|---------------------------|---|
| 1   | 47 CFR Part 2             | Frequency Allocations and Radio Treaty Matters; General Rules and Regulations   |
| 2   | ANSI/IEEE Std. C95.1-1992 | IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz  |
| 3   | IEEE Std. 1528-2003       | Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques |
| 4   | FCC KDB 447498 D01 v05r02 | Mobile and Portable Device RF Exposure Procedures and Equipment Authorization Policies  |
| 5   | FCC KDB 865664 D01 v01r03 | SAR Measurement 100 MHz to 6 GHz  |
| 6   | FCC KDB 865664 D02 v01r01 | RF Exposure Reporting   |

### 3.2 Summary Of SAR Value

Highest SAR

| Position     | Band       | Maximum Measurement SAR (W/kg) | Maximum Report SAR (W/kg) |
|--------------|------------|--------------------------------|---------------------------|
| Head         | GSM 850    | 0.613                          | 0.686                     |
|              | GSM 1900   | 0.582                          |                           |
|              | WCDMA 850  | 0.686                          |                           |
|              | WCDMA 1900 | 0.270                          |                           |
|              | WLAN       | 0.675                          |                           |
|              | BT         | 0.168                          |                           |
| Body-worn    | GSM 850    | 0.550                          | 1.153                     |
|              | GSM 1900   | 0.658                          |                           |
|              | WCDMA 850  | 1.153                          |                           |
|              | WCDMA 1900 | 0.543                          |                           |
|              | WLAN       | 0.262                          |                           |
|              | BT         | 0.156                          |                           |
| Hotspot Mode | GSM 850    | 1.125                          | 1.153                     |
|              | GSM 1900   | 0.774                          |                           |
|              | WCDMA 850  | 1.153                          |                           |
|              | WCDMA 1900 | 0.543                          |                           |
|              | WLAN       | 0.262                          |                           |
|              | BT         | 0.156                          |                           |

Highest Simultaneous SAR

| Position     | Simultaneous Configuration | Maximum Sum. 1-g Report SAR (W/kg) |
|--------------|----------------------------|------------------------------------|
| Head         | WCDMA + WLAN               | 1.361                              |
| Body-worn    | WCDMA + WLAN               | 1.415                              |

### 3.3 Device Category And SAR Limit

This device belongs to portable device category because its radiating structure is allowed to be used within 20 centimeters of the body of the user. Limit for General Population/Uncontrolled exposure should be applied for this device, it is 1.6 W/kg as averaged over any 1 gram of tissue.

Table Of Exposure Limits:

|   | SAR Value (W/Kg)                         |                                  |
|---|--|----------------------------------|
|   | General Population/Uncontrolled Exposure | Occupational/Controlled Exposure |
| <b>Whole-Body SAR</b><br>(averaged over the entire body)                                | 0.08                                     | 0.4                              |
| <b>partial-body SAR</b><br>(averaged over any 1 gram of tissue)                         | 1.60                                     | 8.0                              |
| <b>SAR for hands, wrists, feet and ankles</b><br>(averaged over any 10 grams of tissue) | 4.0                                      | 20.0                             |

NOTE:

**General Population/Uncontrolled:** Locations where there is the exposure of individuals who have no knowledge or control of their exposure. General population/uncontrolled exposure limits are applicable to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Members of the general public would come under this category when exposure is not employment-related; for example, in the case of a wireless transmitter that exposes persons in its vicinity.

**Occupational/Controlled:** Locations where there is exposure that may be incurred by persons who are aware of the potential for exposure. In general, occupational/controlled exposure limits are applicable to situations in which persons are exposed as a consequence of their employment, who have been made fully aware of the potential for exposure and can exercise control over their exposure. This exposure category is also applicable when the exposure is of a transient nature due to incidental passage through a location where the exposure levels may be higher than the general population/uncontrolled limits, but the exposed person is fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

### 3.4 SAR Test Uncertainty

The following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in IEEE 1528: 2003. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2. The system measurement uncertainty frequency range is from 300MHz to 3GHz.

| Uncertainty Component   | Tol<br>(+- %) | Prob.<br>Dist. | Div.       | Ci<br>(1g) | Ci<br>(10g) | 1g Ui<br>(+-%) | 10g Ui<br>(+-%) | Vi  |
|---|---------------|----------------|------------|------------|-------------|----------------|-----------------|-----|
| <b>Measurement System</b>   |               |                |            |            |             |                |                 |     |
| Probe calibration   | 5.8           | N              | 1          | 1          | 1           | 5.80           | 5.80            |     |

## 4 SAR MEASUREMENT SYSTEM

### 4.1 Definition of Specific Absorption Rate (SAR)

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational / controlled exposure limits are higher than the limits for general population /uncontrolled.

The SAR definition is the time derivative (rate) of the incremental energy ( $dW$ ) absorbed by (dissipated in) an incremental mass ( $dm$ ) contained in a volume element ( $dv$ ) of a given density ( $\rho$ ). The equation description is as below:

$$\text{SAR} = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dv} \right)$$

SAR is expressed in units of Watts per kilogram (W/kg) SAR measurement can be related to the electrical field in the tissue by

$$\text{SAR} = \frac{\sigma E^2}{\rho}$$

Where:  $\sigma$  is the conductivity of the tissue,

$\rho$  is the mass density of the tissue and  $E$  is the RMS electrical field strength.

### 4.2 SATIMO SAR System

SATIMO SAR System Diagram:

These measurements were performed with the automated near-field scanning system OPENSAR from SATIMO. The system is based on a high precision robot (working range: 850 mm), which positions the probes with a positional repeatability of better than  $\pm 0.02$  mm. Special E- and H-field probes have been developed for measurements close to material discontinuity, the sensors of which are directly loaded with a Schottky diode and connected via highly resistive lines to the data acquisition unit.

The SAR measurements were conducted with dosimetric probe (manufactured by SATIMO), designed in the classical triangular configuration and optimized for dosimetric evaluation. The probe has been calibrated according to the procedure described in SAR standard with accuracy of better than  $\pm 10\%$ . The spherical isotropy was evaluated with the procedure described in SAR standard and found to be better than  $\pm 0.25$  dB. The phantom used was the SAM Phantom as described in FCC supplement C, IEEE P1528 and CENELEC EN62209-1/-2.

#### 4.2.1 Robot

The SATIMO SAR system uses the high precision robots from KUKA. For the 6-axis controller system, the robot controller version (KUKA) from KUKA is used. The KUKA robot series have many features that are important for our application:

- High precision (repeatability  $\pm 0.035$  mm)
- High reliability (industrial design)
- Jerk-free straight movements
- Low ELF interference (the closed metallic construction shields against motor control fields)

#### 4.2.2 E-Field Probe

For the measurements the Specific Dosimetric E-Field Probe SN 17/13 EPG177 with following specifications is used

- Dynamic range: 0.01-100 W/kg
- Tip Diameter : 2.5 mm
- Distance between probe tip and sensor center: 1.0mm
- Distance between sensor center and the inner phantom surface: 4 mm  
(repeatability better than +/- 1mm)

- Probe linearity: +/- 0.06 dB
  - Axial Isotropy: < 0.15 dB
  - Spherical Isotropy: < 0.15 dB
  - Calibration range: 450MHz to 5800MHz for head & body simulating liquid.
- Angle between probe axis (evaluation axis) and surface normal line: less than 30 °

### E-Field Probe Calibration Process

Probe calibration is realized, in compliance with CENELEC EN 62209-1/2 and IEEE 1528 std, with CALISAR, Antennessa proprietary calibration system. The calibration is performed with the EN 62209-1/2 annexe technique using reference guide at the five frequencies.

$$\text{SAR} = \frac{4(P_{fw} - P_{bw})}{ab\sigma} \cos^2 \left( \pi \frac{y}{a} \right) c^{(2\pi/\sigma)}$$

Where :

P<sub>fw</sub> = Forward Power

P<sub>bw</sub> = Backward Power

a and b = Waveguide dimensions

l = Skin depth

Keithley configuration:

Rate = Medium; Filter =ON; RDGS=10; FILTER TYPE =MOVING AVERAGE; RANGE AUTO After each calibration, a SAR measurement is performed on a validation dipole and compared with a NPL calibrated probe, to verify it.

The calibration factors, CF(N), for the 3 sensors corresponding to dipole 1, dipole 2 and dipole 3 are:

$$CF(N) = SAR(N)/V_{lin}(N) \quad (N=1,2,3)$$

The linearised output voltage  $V_{lin}(N)$  is obtained from the displayed output voltage  $V(N)$  using

$$V_{lin}(N) = V(N) * (1 + V(N)/DCP(N)) \quad (N=1,2,3)$$

Where the DCP is the diode compression point in mV.

#### 4.2.3 Phantoms

For the measurements the Specific Anthropomorphic Mannequin (SAM) defined by the IEEE SCC-34/SC2 group is used. The phantom is a polyurethane shell integrated in a wooden table. The thickness of the phantom amounts to 2mm +/- 0.2mm. It enables the dosimetric evaluation of left and right phone usage and includes an additional flat phantom part for the simplified performance check. The phantom set-up includes a cover, which prevents the evaporation of the liquid.

|                 | 9         | 2.07 | 9          | 2.05 | -         | -    |

#### 4.2.4 Device Holder

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5 mm distance, a positioning uncertainty of  $\pm 0.5$  mm would produce a SAR uncertainty of  $\pm 20\%$ . Accurate positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

| Serial Number         | Holder Material | Permittivity | Loss Tangent |
|-----------------------|-----------------|--------------|--------------|
| <b>SN 25/13 MSH87</b> | Deirin          | 3.7          | 0.005        |
| <b>SN 25/13 MSH88</b> | Deirin          | 3.7          | 0.005        |

The positioning system allows obtaining cheek and tilting position with a very good accuracy. In compliance with CENELEC, the tilt angle uncertainty is lower than  $1^\circ$ .

#### 4.2.5 Simulating Liquid

For SAR measurement of the field distribution inside the phantom, the phantom must be filled with homogeneous tissue simulating liquid to a depth of at least 15 cm. For head SAR testing, the liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is larger than 15 cm. For body SAR testing, the liquid height from the center of the flat phantom to the liquid top surface is larger than 15 cm. The nominal dielectric values of the tissue simulating liquids in the phantom and the tolerance of 5%.

The following table gives the recipes for tissue simulating liquid.

| Frequency<br>(MHz) | Water | Sugar | Cellulose | Salt | Preventol | DGBE | Conductivity | Permittivity |
|--------------------|-------|-------|-----------|------|-----------|------|--------------|--------------|
|                    | %     | %     | %         | %    | %         | %    | $\sigma$     | $\epsilon$   |
| Head               |       |       |           |      |           |      |              |              |
| 750                | 41.1  | 57.0  | 0.2       | 1.4  | 0.2       | 0    | 0.89         | 41.9         |

| 2014.09.24 | Head        | 2450        | 22.3      | 1.79                            | 39.31                             | 1.80                             | 39.20                              | -0.56                      | 0.28                       |
| 2014.09.25 | Body        | 2450        | 22.3      | 1.97                            | 53.12                             | 1.95                             | 52.70                              | 1.03                       | 0.80                       |

**Note:**

1. The tolerance limit of Conductivity and Permittivity is  $\pm 5\%$ .

## 5 SYSTEM VERIFICATION

### 5.1 Antenna Port Test Requirement

The SATIMO SAR system is equipped with one or more system validation kits. These units together with the predefined measurement procedures within the SATIMO software enable the user to conduct the system performance check and system validation. System validation kit includes a dipole, tripod holder to fix it underneath the flat phantom and a corresponding distance holder.

### 5.2 Purpose of System Check

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results. The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.

### 5.3 System Check Setup

In the simplified setup for system evaluation, the EUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave that comes from a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

## 5.4 System Verification Results

Comparing to the original SAR value provided by SATIMO, the validation data should be within its specification of 10 %.

| Date       | Liquid Type | Freq. (MHz) | Power (mW) | Measured SAR (W/kg) | Normalized SAR (W/kg) | Dipole SAR (W/kg) | Tolerance (%) | Targeted SAR(W/kg) | Tolerance (%) |
|------------|-------------|-------------|------------|---------------------|-----------------------|-------------------|---------------|--------------------|---------------|
| 2014.09.24 | Head        | 835         | 100        | 0.937               | 9.37                  | 9.71              | -3.50         | 9.50               | -1.37         |
| 2014.09.25 | Body        | 835         | 100        | 1.008               | 10.08                 | 10.19             | 4.81          | 9.56               | 5.44          |
| 2014.09.24 | Head        | 1900        | 100        | 3.774               | 37.74                 | 40.01             | -5.67         | 39.70              | -4.94         |
| 2014.09.25 | Body        | 1900        | 100        | 4.142               | 41.42                 | 40.32             | 2.73          | 39.70              | 4.33          |
| 2014.09.24 | Head        | 2450        | 100        | 5.393               | 53.93                 | 53.96             | -0.06         | 52.40              | 2.92          |
| 2014.09.25 | Body        | 2450        | 100        | 5.123               | 51.23                 | 52.37             | -2.18         | 52.40              | -2.23         |

Note:

1. The tolerance limit of System validation ±10%.

## 6 EUT TEST POSITION CONFIGURATIONS

According to KDB 648474 D04 Handset v01r02, handsets are tested for SAR compliance in head, body-worn accessory and other use configurations described in the following subsections.

### 6.1 Head Exposure Conditions

Head exposure is limited to next to the ear voice mode operations. Head SAR compliance is tested according to the test positions defined in IEEE Std 1528-2003 using the SAM phantom illustrated as below.

#### 6.1.1 Define two imaginary lines on the handset

- (a) The vertical centerline passes through two points on the front side of the handset - the midpoint of the width  $w_t$  of the handset at the level of the acoustic output, and the midpoint of the width  $w_b$  of the bottom of the handset.
- (b) The horizontal line is perpendicular to the vertical centerline and passes through the center of the acoustic output. The horizontal line is also tangential to the face of the handset at point A.
- (c) The two lines intersect at point A. Note that for many handsets, point A coincides with the center of the acoustic output; however, the acoustic output may be located elsewhere on the horizontal line. Also note that the vertical centerline is not necessarily parallel to the front face of the handset, especially for clamshell handsets, handsets with flip covers, and other irregularly shaped handsets.

#### 6.1.2 Cheek Position

- (a) To position the device with the vertical center line of the body of the device and the horizontal line crossing the center piece in a plane parallel to the sagittal plane of the phantom. While maintaining the device in this plane, align the vertical center line with the reference plane containing the three ear and mouth reference point (M: Mouth, RE: Right Ear, and LE: Left Ear) and align the center of the ear piece with the line RE-LE.
- (b) To move the device towards the phantom with the ear piece aligned with the line LE-RE until the phone touched the ear. While maintaining the device in the reference plane and maintaining the phone contact with the ear, move the bottom of the phone until any point on the front side is in contact with the cheek of the phantom or until contact with the ear is lost.

### 6.1.3 Tilted Position

- To position the device in the “cheek” position described above.
- While maintaining the device the reference plane described above and pivoting against the ear, moves it outward away from the mouth by an angle of 15 degrees or until contact with the ear is lost.

## 6.2 Body-worn Position Conditions

Body-worn accessory exposure is typically related to voice mode operations when handsets are carried in body-worn accessories. The body-worn accessory procedures in KDB 447498 are used to test for body-worn accessory SAR compliance, without a headset connected to it. This enables the test results for such configuration to be compatible with that required for hotspot mode when the body-worn accessory test separation distance is greater than or equal to that required for hotspot mode. When the reported SAR for a body-worn accessory, measured without a headset connected to the handset, is  $> 1.2 \text{ W/kg}$ , the highest reported SAR configuration for that wireless mode and frequency band should be repeated for that body-worn accessory with a headset attached to the handset.

Body-worn accessories that do not contain metallic or conductive components may be tested according to worst-case exposure configurations, typically according to the smallest test separation distance required for the group of body-worn accessories with similar operating and exposure characteristics. All body-worn accessories containing metallic components are tested in conjunction with the host device.

Body-worn accessory SAR compliance is based on a single minimum test separation distance for all wireless and operating modes applicable to each body-worn accessory used by the host, and according to the relevant voice and/or data mode transmissions and operations. If a body-worn accessory supports voice only operations in its normal and expected use conditions, testing of data mode for body-worn compliance is not required. A conservative minimum test separation distance for supporting off-the-shelf body-worn accessories that may be

acquired by users of consumer handsets is used to test for body-worn accessory SAR compliance. This distance is determined by the handset manufacturer, according to the requirements of Supplement C 01-01. Devices that are designed to operate on the body of users using lanyards and straps, or without requiring additional body-worn accessories, will be tested using a conservative minimum test separation distance  $\leq 5$  mm to support compliance.

### 6.3 Hotspot Mode Exposure Position Conditions

For handsets that support hotspot mode operations, with wireless router capabilities and various web browsing functions, the relevant hand and body exposure conditions are tested according to the hotspot SAR procedures in KDB 941225. A test separation distance of 10 mm is required between the phantom and all surfaces and edges with a transmitting antenna located within 25 mm from that surface or edge. When the form factor of a handset is smaller than 9 cm x 5 cm, a test separation distance of 5 mm (instead of 10 mm) is required for testing hotspot mode. When the separation distance required for body-worn accessory testing is larger than or equal to that tested for hotspot mode, in the same wireless mode and for the same surface of the phone, the hotspot mode SAR data may be used to support body-worn accessory SAR compliance for that particular configuration (surface).

## 7 SAR MEASUREMENT PROCEDURES

### 7.1 SAR Measurement Process Diagram

## 7.2 SAR Scan General Requirements

Probe boundary effect error compensation is required for measurements with the probe tip closer than half a probe tip diameter to the phantom surface. Both the probe tip diameter and sensor offset distance must satisfy measurement protocols; to ensure probe boundary effect errors are minimized and the higher fields closest to the phantom surface can be correctly measured and extrapolated to the phantom surface for computing 1-g SAR. Tolerances of the post-processing algorithms must be verified by the test laboratory for the scan resolutions used in the SAR measurements, according to the reference distribution functions specified in IEEE Std 1528-2003.

|   |   | $\leq 3\text{GHz}$  | $> 3\text{GHz}$   |
|---|---|---|---|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface  |   | $5 \pm 1 \text{ mm}$  | $\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5 \text{ mm}$  |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location   |   | $30^\circ \pm 1^\circ$  | $20^\circ \pm 1^\circ$  |
|   |   | $\leq 2 \text{ GHz: } \leq 15 \text{ mm}$<br>$2 - 3 \text{ GHz: } \leq 12 \text{ mm}$ | $3 - 4 \text{ GHz: } \leq 12 \text{ mm}$<br>$4 - 6 \text{ GHz: } \leq 10 \text{ mm}$  |
| Maximum area scan spatial resolution: $\Delta x \text{ Area}, \Delta y \text{ Area}$  |   |   | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be the corresponding x or y dimension of the test device with at least one measurement point on the test device. |
| Maximum zoom scan spatial resolution: $\Delta x \text{ Zoom}, \Delta y \text{ Zoom}$  |   | $\leq 2 \text{ GHz: } \leq 8 \text{ mm}$<br>$2 - 3 \text{ GHz: } \leq 5 \text{ mm}^*$ | $3 - 4 \text{ GHz: } \leq 5 \text{ mm}^*$<br>$4 - 6 \text{ GHz: } \leq 4 \text{ mm}^*$  |
| Maximum zoom scan spatial resolution, normal to phantom surface   | uniform grid: $\Delta z \text{ Zoom (n)}$                               |   | $3 - 4 \text{ GHz: } \leq 4 \text{ mm}$<br>$4 - 5 \text{ GHz: } \leq 3 \text{ mm}$<br>$5 - 6 \text{ GHz: } \leq 2 \text{ mm}$   |
|   | graded grid   | $\leq 5 \text{ mm}$   | $3 - 4 \text{ GHz: } \leq 3 \text{ mm}$<br>$4 - 5 \text{ GHz: } \leq 2.5 \text{ mm}$  |
|   |   |   | $5 - 6 \text{ GHz: } \leq 2 \text{ mm}$   |
|   | $z \text{ Zoom (1): between 1st two points closest to phantom surface}$ | $\leq 4 \text{ mm}$   | $\leq 1.5 \cdot \Delta z \text{ Zoom (n-1)}$  |
| Minimum zoom scan volume  | $x, y, z$   | $\geq 30 \text{ mm}$  | $3 - 4 \text{ GHz: } \geq 28 \text{ mm}$<br>$4 - 5 \text{ GHz: } \geq 25 \text{ mm}$<br>$5 - 6 \text{ GHz: } \geq 22 \text{ mm}$  |
| <p>Note:</p> <ol style="list-style-type: none"> <li>is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.</li> <li>* When zoom scan is required and the reported SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is 1.4 W/kg, 8 mm, 7 mm and 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.</li> </ol> |   |   |   |

## 7.3 SAR Measurement Procedure

The following steps are used for each test position

- Establish a call with the maximum output power with a base station simulator. The connection between the mobile and the base station simulator is established via air interface
- Measurement of the local E-field value at a fixed location. This value serves as a reference value for calculating a possible power drift.
- Measurement of the SAR distribution with a grid of 8 to 16mm \* 8 to16 mm and a constant distance to the inner surface of the phantom. Since the sensors cannot directly measure at the inner phantom surface, the values between the sensors and the inner phantom surface are extrapolated. With these values the area of the maximum SAR is calculated by an interpolation scheme.
- Around this point, a cube of 30 \* 30 \* 30 mm or 32 \* 32 \* 32 mm is assessed by measuring 5 or 8 \* 5 or 8\*4 or 5 mm. With these data, the peak spatial-average SAR value can be calculated.
- 

## 7.4 Area & Zoom Scan Procedures

First Area Scan is used to locate the approximate location(s) of the local peak SAR value(s). The measurement grid within an Area Scan is defined by the grid extent, grid step size and grid offset. Next, in order to determine the EM field distribution in a three-dimensional spatial extension, Zoom Scan is required. The Zoom Scan is performed around the highest E-field value to determine the averaged SAR-distribution over 10 g. Area scan and zoom scan resolution setting follows KDB 865664 D01v01r03 quoted below.

When the 1-g SAR of the highest peak is within 2 dB of the SAR limit, additional zoom scans are required for other peaks within 2 dB of the highest peak that have not been included in any zoom scan to ensure there is no increase in SAR.

## 8 CONDUCTED RF OUTPUT POWER

The GSM mode measurement conducted power as following:

| GSM850 Band          | Burst Average Power (dBm) |        |        | Fram- Average Power (dBm) |        |              |
|----------------------|---------------------------|--------|--------|---------------------------|--------|--------------|
| Channel              | 128                       | 190    | 251    | 128                       | 190    | 251          |
| Frequency (MHz)      | 824.2                     | 836.6  | 848.8  | 824.2                     | 836.6  | 848.8        |
| GSM (GMSK, 1-Slot)   | 31.46                     | 31.52  | 31.54  | 22.46                     | 22.72  | <b>22.74</b> |
| GPRS (GSMK, 1-Slot)  | 31.47                     | 31.54  | 31.55  | 22.47                     | 22.74  | 22.75        |
| GPRS (GSMK, 2-Slot)  | 30.20                     | 30.29  | 30.36  | 24.20                     | 24.29  | <b>24.36</b> |
| GPRS (GSMK, 3-Slot)  | 28.24                     | 28.37  | 28.44  | 23.98                     | 24.11  | 24.18        |

**Note:**

1. SAR testing was performed on the maximum frame-averaged power mode.
2. The frame-averaged power is linearly proportion to the slot number configured and it is linearly scaled the maximum burst-averaged power based on time slots. The calculated method is shown as below:

$$\text{Frame-averaged power} = \text{Burst averaged power (1 Tx Slot)} - 9 \text{ dB}$$

$$\text{Frame-averaged power} = \text{Burst averaged power (2 Tx Slots)} - 6 \text{ dB}$$

$$\text{Frame-averaged power} = \text{Burst averaged power (3 Tx Slots)} - 4.26 \text{ dB}$$

$$\text{Frame-averaged power} = \text{Burst averaged power (4 Tx Slots)} - 3 \text{ dB}$$

The WCDMA mode measurement conducted power as:

| Band            | WCDMA 850 |              |       | WCDMA 1900 |              |        |

|                 | 802.11n(HT20)    | 6.27            | 4.24    | No                           | No             | No           | No            | No          | No             |
| Bluetooth       | Distance to User |                 |         | <5mm                         | <5mm           | 23mm         | 8mm           | <5mm        | 102mm          |
|                 | BT               | 14.29           | 26.85   | Yes                          | Yes            | Yes          | Yes           | Yes         | No             |

**Note:**

1. Maximum power is the source-based time-average power and represents the maximum RF output power among production units
2. Per KDB 447498 D01v05r02, for larger devices, the test separation distance of adjacent edge configuration is determined by the closest separation between the antenna and the user.
3. Per KDB 447498 D01v05r02, standalone SAR test exclusion threshold is applied; If the distance of the antenna to the user is < 5mm, 5mm is used to determine SAR exclusion threshold
4. Per KDB 447498 D01v05r02, the 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances 50 mm are determined by:

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [f(\text{GHz})] = 3.0 \text{ for}$$

1-g SAR and 7.5 for 10-g extremity SAR

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

For < 50 mm distance, we just calculate mW of the exclusion threshold value (3.0) to do compare.

This formula is  $[3.0] / [f(\text{GHz})] \cdot [(\text{min. test separation distance, mm})] = \text{exclusion threshold of mW.}$

5. Per KDB 447498 D01v05r02, at 100 MHz to 6 GHz and for test separation distances > 50 mm, the SAR test exclusion threshold is determined according to the following
  - a) [Threshold at 50 mm in step 1] + (test separation distance - 50 mm) · (f(MHz)/150) mW, at 100 MHz to 1500 MHz
  - b) [Threshold at 50 mm in step 1] + (test separation distance - 50 mm) · 10] mW at > 1500 MHz and 6 GHz
6. Per KDB 941225 D02v02r02, RMC 12.2kbps setting is used to evaluate SAR. If HSDPA /HSUPA /DC-HSDPA output power is < 0.25dB higher than RMC12.2Kbps, or reported SAR with RMC 12.2kbps setting is 1.2W/kg,

HSDPA/HSUPA/DC-HSDPA SAR evaluation can be excluded.

7. Per KDB 248227 D01 v01r02, choose the highest output power channel to test SAR and determine further SAR exclusion.  
For each frequency band, testing at higher data rates and higher order modulations is not required when the maximum average output power for each of these configurations is less than 1/4dB higher than those measured at the lowest data rate
9. Apply the test exclusion rule in KDB 248227 D01 v01r02 11g, 11n-HT20 and HT40 output power is less than 1/4dB higher than 11b mode, thus the SAR can be excluded.

## 9.2 10-g Extremity Exposure Consider

According with FCC KDB 648474 D04 v01r02, for smart phones with a display diagonal dimension > 15.0 cm or an overall diagonal dimension > 16.0 cm that provide similar mobile web access and multimedia support found in mini-tablets or UMPC mini-tablets that support voice calls next to the ear, unless it is confirmed otherwise through KDB inquiries, the following phablet procedures should be applied to evaluate SAR compliance for each applicable wireless modes and frequency band. Devices marketed as phablets, regardless of form factors and operating characteristics must be tested as a phablet to determine SAR compliance;

The UMPC mini-tablet procedures must also be applied to test the SAR of all surfaces and edges with an antenna located at 25 mm from that surface or edge, in direct contact with a flat phantom, for 10-g extremity SAR according to the body-equivalent tissue dielectric parameters in KDB 865664 to address interactive hand use exposure conditions. The UMPC mini-tablet 1-g SAR at 5 mm is not required. When hotspot mode applies, 10-g extremity SAR is required only for the surfaces and edges with hotspot mode 1-g reported SAR > 1.2 W/kg.

### Conclusion:

1. The diagonal dimension is 12 cm, which is less than 16 cm.  
10-g extremity SAR is not required.

# 10 SAR TEST RESULTS

## 10.3 SAR Measurement Variability

According to KDB 865664 D01 v01r03, SAR measurement variability was assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements. When both head and body tissue-equivalent media are required for SAR measurements in a frequency band, the variability measurement procedures should be applied to the tissue medium with the highest measured SAR, using the highest measured SAR configuration for that tissue-equivalent medium. Alternatively, if the highest measured SAR for both head and body tissue-equivalent media are  $\leq 1.45 \text{ W/kg}$  and the ratio of these highest SAR values, i.e., largest divided by smallest value, is  $\leq 1.10$ , the highest SAR configuration for either head or body tissue-equivalent medium may be used to perform the repeated measurement. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

### SAR repeated measurement procedure:

1. When the highest measured SAR is  $< 0.80 \text{ W/kg}$ , repeated measurement is not required.
2. When the highest measured SAR is  $\geq 0.80 \text{ W/kg}$ , repeat that measurement once.
3. If the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$ , or when the original or repeated measurement is  $\geq 1.45 \text{ W/kg}$ , perform a second repeated measurement.
4. If the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ , and the original, first or second repeated measurement is  $\geq 1.5 \text{ W/kg}$ , perform a third repeated measurement.

### SAR Repeated Measurement

| Band     | Mode | Position  | Ch.  | Freq. | Original | first<br>repeated | ratio | second<br>repeated | ratio | Third<br>repeated | ratio |
|----------|------|-----------|------|-------|----------|-------------------|-------|--------------------|-------|-------------------|-------|
| GSM850   | GPRS | Back Side | 128  | 824.2 | 1.040    | 1.101             | 1.06  | -                  | -     | -                 | -     |
|          |      |           | 190  | 836.6 | 1.035    | 1.028             | 1.01  | -                  | -     | -                 | -     |
|          |      |           | 251  | 848.8 | 1.087    | 1.057             | 1.03  | -                  | -     | -                 | -     |
| WCDMA850 | RMC  | Back Side | 4132 | 826.4 | 1.056    | 0.953             | 1.11  | -                  | -     | -                 | -     |
|          |      |           | 4182 | 836.6 | 0.951    | 0.962             | 1.01  | -                  | -     | -                 | -     |
|          |      |           | 4233 | 846.6 | 1.021    | 1.018             | 1.01  | -                  | -     | -                 | -     |

#### Note:

1. The ratio of largest to smallest SAR for the original and first repeated measurements is  $< 1.20$ , the second repeated measurement is not necessary.

## 11 SIMULTANEOUS TRANSMISSION

### 11.1 Simultaneous Transmission Mode Consider

| Simultaneous Transmitting ( Yes/NO ) | BT  | WLAN | WCDMA RMC | GSM Data | GSM Voice |
|--------------------------------------|-----|------|-----------|----------|-----------|
| GSM Voice                            | Yes | Yes  | NO        | NO       | -         |
| GSM Data                             | Yes | Yes  | NO        | -        | -         |
| WCDMA RMC                            | Yes | Yes  | -         | -        | -         |
| WLAN                                 | NO  | -    | -         | -        | -         |
| BT                                   | -   | -    | -         | -        | -         |

Note: The BT and WLAN share the same PIFA antenna, cannot transmitting together.

## 11.2 Sum SAR of Simultaneous Transmission

| Simultaneous Mode | Position        | Mode      | Max. 1-g SAR<br>(W/kg) | 1-g Sum SAR<br>(W/kg) |
|-------------------|-----------------|-----------|------------------------|-----------------------|

Simultaneous transmission SAR test exclusion is determined for each operating configuration and exposure condition according to the reported standalone SAR of each applicable simultaneous transmitting antenna. When the sum of SAR 1g of all simultaneously transmitting antennas in an operating mode and exposure condition combination is within the SAR limit (SAR 1g 1.6 W/kg), the simultaneous transmission SAR is not required. When the sum of SAR 1g is greater than the SAR limit (SAR 1g 1.6 W/kg), SAR test exclusion is determined by the SPLSR.

## 12 TEST EQUIPMENTS LIST

| Description                     | Manufacturer | Model           | Serial No.              | Cal. Date  | Cal. Due   |

## ANNEX A SAR TEST RESULT OF SYSTEM VERIFICAION

### System Performance Check Data(835MHz Head)

Type: Phone measurement (Complete)

Area scan resolution: dx=8mm,dy=8mm

Zoom scan resolution: dx=8mm, dy=8mm, dz=5mm

Date of measurement: 2014.09.24

Measurement duration: 14 minutes 22 seconds

#### Experimental conditions.

### Z Axis Scan

# System Performance Check Data(2450MHz Body)

Type: Phone measurement (Complete)

Area scan resolution: dx=8mm,dy=8mm

Zoom scan resolution: dx=8mm, dy=8mm, dz=5mm

Date of measurement: 2014.9.25

Measurement duration: 14 minutes 46 seconds

## Experimental conditions.

## MEAS. 1 Left Head with Cheek on High Channel in GSM850 mode

**Test Date:** 2014.9.24  
**Signal:** GSM850, f=848.8 MHz, Duty Cycle: 1:8.3  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-48.000000, Y=-32.000000  
**SAR 10g (W/Kg):** 0.407481  
**SAR 1g (W/Kg):** 0.577045  
**Power drift (%):** -2.02  
**3D screen shot**

### Z Axis Scan

## MEAS. 2 Left Head with Tilt on High Channel in GSM850 mode

**Test Date:** 2014.9.24  
**Signal:** GSM850, f=848.8 MHz, Duty Cycle: 1:8.3  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-32.000000, Y=-16.000000  
**SAR 10g (W/Kg):** 0.220572  
**SAR 1g (W/Kg):** 0.306725  
**Power drift (%):** 3.88  
**3D screen shot**

### Z Axis Scan

## MEAS. 3 Right Head with Cheek on High Channel in GSM850 mode

**Test Date:** 2014.9.24  
**Signal:** GSM850, f=848.8 MHz, Duty Cycle: 1:8.3  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-48.000000, Y=-32.000000  
**SAR 10g (W/Kg):** 0.368551  
**SAR 1g (W/Kg):** 0.520362  
**Power drift (%):** -1.42  
**3D screen shot**

### Z Axis Scan

## MEAS. 4 Right Head with Tilt on High Channel in GSM850 mode

**Test Date:** 2014.9.24  
**Signal:** GSM850, f=848.8 MHz, Duty Cycle: 1:8.3  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-32.000000, Y=-16.000000  
**SAR 10g (W/Kg):** 0.220988  
**SAR 1g (W/Kg):** 0.300426  
**Power drift (%):** -0.91  
**3D screen shot**

### Z Axis Scan

## MEAS. 5 Body Plane with Body on High Channel in GSM850 mode

**Test Date:** 2014.9.25  
**Signal:** GSM850, f=848.8 MHz, Duty Cycle: 1:8.3  
**Liquid Parameters:** Permittivity: 55.26; Conductivity: 0.99 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 24.58  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-8.000000, Y=40.000000  
**SAR 10g (W/Kg):** 0.318688  
**SAR 1g (W/Kg):** 0.445733  
**Power drift (%):** -2.24  
**3D screen shot**

## MEAS. 35 Body Plane with Body on Low Channel in EGPRS1900 mode

**Test Date:** 2014.9.24  
**Signal:** EGPRS, f=1850.2 MHz, Duty Cycle: 1:2.6  
**Liquid Parameters:** Permittivity: 55.26; Conductivity: 0.99 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 27.47  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=8.000000, Y=-41.000000  
**SAR 10g (W/Kg):** 0.238241  
**SAR 1g (W/Kg):** 0.464199  
**Power drift (%):** -1.44  
**3D screen shot**

### Z Axis Scan

## MEAS. 36 Right Head with Tilt on Middle Channel in WCDMA850 mode

**Test Date:** 2014.9.24  
**Signal:** WCDMA850, f=836.6 MHz, Duty Cycle: 1:1.0  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-41.000000, Y=-24.000000  
**SAR 10g (W/Kg):** 0.211190  
**SAR 1g (W/Kg):** 0.291093  
**Power drift (%):** -0.26  
**3D screen shot**

### Z Axis Scan

**MEAS. 37 Left Head with Cheek on Middle Channel in WCDMA850 mode**

**Test Date:** 2014.9.24  
**Signal:** WCDMA850, f=836.6 MHz, Duty Cycle: 1:1.0  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-48.000000, Y=-32.000000  
**SAR 10g (W/Kg):** 0.387199  
**SAR 1g (W/Kg):** 0.587437  
**Power drift (%):** -92.10  
**3D screen shot**

**Z Axis Scan**

## MEAS. 38 Left Head with Tilt on Middle Channel in WCDMA850 mode

**Test Date:** 2014.9.24  
**Signal:** WCDMA850, f=836.6 MHz, Duty Cycle: 1:1.0  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:** X=-32.000000, Y=-24.000000  
**SAR 10g (W/Kg):** 0.221131  
**SAR 1g (W/Kg):** 0.301521  
**Power drift (%):** -0.48  
**3D screen shot**

### Z Axis Scan

## MEAS. 39 Right Head with Cheek on Middle Channel in WCDMA850 mode

**Test Date:** 2014.9.24  
**Signal:** WCDMA850, f=846.6 MHz, Duty Cycle: 1:1.0  
**Liquid Parameters:** Permittivity: 40.40; Conductivity: 0.92 S/m  
**Test condition:** Ambient Temperature: 22.7°C, Liquid Temperature: 22.3°C  
**Probe:** EPG 210, ConvF: 23.67  
**Area Scan:** sam\_direct\_droit2\_surf8mm.txt, h= 5.00 mm  
**Zoom Scan:** 5x5x7,dx=8mm, dy=8mm, dz=5mm,Complete  
**Maximum location:**

05/16/2014

#### Summary:

This document presents the method and results from an accredited COMOSAR Dosimetric E-Field Probe calibration performed in SATIMO USA using the CALISAR / CALIBAIR test bench, for use with a SATIMO COMOSAR system only. All calibration results are traceable to national metrology institutions.

A yearly calibration interval is recommended.

**2 PRODUCT DESCRIPTION****2.1 GENERAL INFORMATION**

Satimo's COMOSAR E field Probes are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards.

Figure 1 – Satimo COMOSAR Dosimetric E field Dipole

|  |        |
|--|--------|
| Probe Length                               | 330 mm |
| Length of Individual Dipoles               | 2 mm   |
| Maximum external diameter                  | 8 mm   |
| Probe Tip External Diameter                | 2.5 mm |
| Distance between dipoles / probe extremity | 1 mm   |

**3 MEASUREMENT METHOD**

The IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards provide recommended practices for the probe calibrations, including the performance characteristics of interest and methods by which to assess their affect. All calibrations / measurements performed meet the fore mentioned standards.

**3.1 LINEARITY**

The evaluation of the linearity was done in free space using the waveguide, performing a power sweep to cover the SAR range 0.01W/kg to 100W/kg.

## COMOSAR E-FIELD PROBE CALIBRATION REPORT

Ref: ACR.155.1.14.SATU.A

### 3.2 SENSITIVITY

The sensitivity factors of the three dipoles were determined using a two step calibration method (air and tissue simulating liquid) using waveguides as outlined in the standards.

### 3.3 LOWER DETECTION LIMIT

The lower detection limit was assessed using the same measurement set up as used for the linearity measurement. The required lower detection limit is 10 mW/kg.

### 3.4 ISOTROPY

The axial isotropy was evaluated by exposing the probe to a reference wave from a standard dipole with the dipole mounted under the flat phantom in the test configuration suggested for system validations and checks. The probe was rotated along its main axis from 0 - 360 degrees in 15 degree steps. The hemispherical isotropy is determined by inserting the probe in a thin plastic box filled with tissue-equivalent liquid, with the plastic box illuminated with the fields from a half wave dipole. The dipole is rotated about its axis (0°–180°) in 15° increments. At each step the probe is rotated about its axis (0°–360°).

### 3.5 BOUNDARY EFFECT

The boundary effect is defined as the deviation between the SAR measured data and the expected exponential decay in the liquid when the probe is oriented normal to the interface. To evaluate this effect, the liquid filled flat phantom is exposed to fields from either a reference dipole or waveguide. With the probe normal to the phantom surface, the peak spatial average SAR is measured and compared to the analytical value at the surface.

## 4 MEASUREMENT UNCERTAINTY

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty associated with an E-field probe calibration using the waveguide technique. All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

| Uncertainty analysis of the probe calibration in waveguide |                       |                          |            |    |                          |
|--|-----------------------|--------------------------|------------|----|--------------------------|
| Error Sources  | Uncertainty value (%) | Probability Distribution | Divisor    | ci | Standard Uncertainty (%) |
| Incident or forward power                                  | 3.00%                 | Rectangular              | $\sqrt{3}$ | 1  | 1.732%                   |

## 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

## 2 DEVICE UNDER TEST

| Device Under Test              |                                  |
|--------------------------------|----------------------------------|
| Device Type                    | COMOSAR 835 MHz REFERENCE DIPOLE |
| Manufacturer                   | Satimo                           |
| Model                          | SID835                           |
| Serial Number                  | SN 25/13 DIP 0G835-246           |
| Product Condition (new / used) | New                              |

A yearly calibration interval is recommended.

## 3 PRODUCT DESCRIPTION

### 3.1 GENERAL INFORMATION

Satimo's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

**Figure 1 – Satimo COMOSAR Validation Dipole**

#### 4 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

##### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

##### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

#### 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ , traceable to the Internationally Accepted Guides to Measurement Uncertainty.

##### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz    | 0.1 dB                              |

##### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300     | 0.05 mm                        |

##### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g         | 20.3 %               |
| 10 g        | 20.1 %               |

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.219.4.13.SATUA

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, OET 65 Bulletin C and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

### 7.1 MEASUREMENT CONDITION

|   |   |
|---|---|
| Software                                  | OPENSAR V4  |

### 7.3 MEASUREMENT RESULT

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

| Frequency<br>MHz | 1 g SAR (W/kg/W) |             | 10 g SAR (W/kg/W) |             |
|------------------|------------------|-------------|-------------------|-------------|
|                  | required         | measured    | required          | measured    |
| 300              | 2.85             |             | 1.94              |             |
| 450              | 4.58             |             | 3.06              |             |
| 750              | 8.49             |             | 5.55              |             |
| 835              | 9.56             | 9.71 (0.97) | 6.22              | 6.21 (0.62) |
| 900              | 10.9             |             | 6.99              |             |
| 1450             | 29               |             | 16                |             |
| 1500             | 30.5             |             | 16.8              |             |
| 1640             | 34.2             |             | 18.4              |             |

### Summary:

This document presents the method and results from an accredited SAR reference dipole calibration performed in SATIMO USA using the COMOSAR test bench. All calibration results are traceable to national metrology institutions.

## 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

## 2 DEVICE UNDER TEST

| Device Under Test              |                                   |
|--------------------------------|-----------------------------------|
| Device Type                    | COMOSAR 1900 MHz REFERENCE DIPOLE |

| Model                          | SID1900                           |
| Serial Number                  | SN 25/13 DIP 1G900-249            |
| Product Condition (new / used) | New                               |

A yearly calibration interval is recommended.

## 3 PRODUCT DESCRIPTION

### 3.1 GENERAL INFORMATION

Satimo's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

**Figure 1 – Satimo COMOSAR Validation Dipole**

#### 4 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

##### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

##### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

#### 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ , traceable to the Internationally Accepted Guides to Measurement Uncertainty.

##### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz    | 0.1 dB                              |

##### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300     | 0.05 mm                        |

##### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g         | 20.3 %               |
| 10 g        | 20.1 %               |

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.219.7.13.SATUA

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, OET 65 Bulletin C and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

### 7.1 MEASUREMENT CONDITION

|   |   |
|---|---|
| Software                                  | OPENSAR V4  |
| Phantom                                   | SN 20/09 SAM71  |
| Probe                                     | SN 18/11 EPG122                                       |
| Liquid                                    | Head Liquid Values: $\epsilon_r'$ : 39.8 sigma : 1.43 |
| Distance between dipole center and liquid | 10.0 mm   |
| Area scan resolution                      | $dx=8mm/dy=8mm$                                       |
| Zoon Scan Resolution                      | $dx=8mm/dy=8mm/dz=5mm$                                |
| Frequency                                 | 1900 MHz  |
| Input power                               | 20 dBm  |
| Liquid Temperature                        | 21 °C   |
| Lab Temperature                           | 21 °C   |
| Lab Humidity                              | 45 %  |

### 7.2 HEAD LIQUID MEASUREMENT

| Frequency<br>MHz | Relative permittivity ( $\epsilon_r'$ ) |          | Conductivity (σ) S/m |          |
|------------------|---|----------|----------------------|----------|
|                  | required                                | measured | required             | measured |
| 300              | 45.3 ± 5 %                              |          | 0.87 ± 5 %           |          |
| 450              | 43.5 ± 5 %                              |          | 0.87 ± 5 %           |          |
| 750              | 41.9 ± 5 %                              |          | 0.89 ± 5 %           |          |
| 835              | 41.5 ± 5 %                              |          | 0.90 ± 5 %           |          |
| 900              | 41.5 ± 5 %                              |          | 0.97 ± 5 %           |          |
| 1450             | 40.5 ± 5 %                              |          | 1.20 ± 5 %           |          |
| 1500             | 40.4 ± 5 %                              |          | 1.23 ± 5 %           |          |
| 1640             | 40.2 ± 5 %                              |          | 1.31 ± 5 %           |          |
| 1750             | 40.1 ± 5 %                              |          | 1.37 ± 5 %           |          |
| 1800             | 40.0 ± 5 %                              |          | 1.40 ± 5 %           |          |
| 1900             | 40.0 ± 5 %                              | PASS     | 1.40 ± 5 %           | PASS     |
| 1950             | 40.0 ± 5 %                              |          | 1.40 ± 5 %           |          |
| 2000             | 40.0 ± 5 %                              |          | 1.40 ± 5 %           |          |
| 2100             | 39.8 ± 5 %                              |          | 1.49 ± 5 %           |          |
| 2300             | 39.5 ± 5 %                              |          | 1.67 ± 5 %           |          |
| 2450             | 39.2 ± 5 %                              |          | 1.80 ± 5 %           |          |
| 2600             | 39.0 ± 5 %                              |          | 1.96 ± 5 %           |          |
| 3000             | 38.5 ± 5 %                              |          | 2.40 ± 5 %           |          |
| 3500             | 37.9 ± 5 %                              |          | 2.91 ± 5 %           |          |

### 7.3 MEASUREMENT RESULT

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

| Frequency<br>MHz | 1 g SAR (W/kg/W) |              | 10 g SAR (W/kg/W) |              |
|------------------|------------------|--------------|-------------------|--------------|
|                  | required         | measured     | required          | measured     |
| 300              | 2.85             |              | 1.94              |              |
| 450              | 4.58             |              | 3.06              |              |
| 750              | 8.49             |              | 5.55              |              |
| 835              | 9.56             |              | 6.22              |              |
| 900              | 10.9             |              | 6.99              |              |
| 1450             | 29               |              | 16                |              |

## 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

## 2 DEVICE UNDER TEST

|--------------------------------|-----------------------------------|
| Device Type                    | COMOSAR 2450 MHz REFERENCE DIPOLE |
| Manufacturer                   | Satimo                            |
| Model                          | SID2450                           |
| Serial Number                  | SN 25/13 DIP 2G450-251            |
| Product Condition (new / used) | New                               |

A yearly calibration interval is recommended.

## 3 PRODUCT DESCRIPTION

### 3.1 GENERAL INFORMATION

Satimo's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

**Figure 1 – Satimo COMOSAR Validation Dipole**

#### 4 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

##### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

##### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

#### 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ , traceable to the Internationally Accepted Guides to Measurement Uncertainty.

##### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz    | 0.1 dB                              |

##### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300     | 0.05 mm                        |

##### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g         | 20.3 %               |
| 10 g        | 20.1 %               |

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.219.9.13.SATUA

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, OET 65 Bulletin C and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

## SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.219.9.13.SATUA

### 7.3 MEASUREMENT RESULT

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

| Frequency<br>MHz | 1 g SAR (W/kg/W) |              | 10 g SAR (W/kg/W) |              |
|------------------|------------------|--------------|-------------------|--------------|
|                  | required         | measured     | required          | measured     |
| 300              | 2.85             |              | 1.94              |              |
| 450              | 4.58             |              | 3.06              |              |
| 750              | 8.49             |              | 5.55              |              |
| 835              | 9.56             |              | 6.22              |              |
| 900              | 10.9             |              | 6.99              |              |
| 1450             | 29               |              | 16                |              |
| 1500             | 30.5             |              | 16.8              |              |
| 1640             | 34.2             |              | 18.4              |              |
